Proposed Architecture: Changes and Reasons

The current site has strong rankings, but its pages sit side by side with no structure connecting them. Most service and location pages can only be reached through the Quick Links in the footer, and several services listed on the website have no page of their own. The proposed architecture organizes the existing pages into a clear hierarchy and adds the pages needed to cover everything Fit4Steps offers.

All pages that currently rank keep their existing URLs, so none of the current rankings are put at risk.

1. Senior Citizen Training becomes the main service pillar

What changed: Senior Citizen Training and Joint Restoration becomes the lead service, with Fitness Training for 50+, Strength Training for Seniors, Joint Restoration and Knee Pain Therapy, and Mobility and Balance Training organized beneath it.

Why: 16 of the website's 23 top-3 rankings in August 2026 are for senior fitness keywords, and most client testimonials describe recovery from knee and joint problems. This is where Fit4Steps already has the most authority with Google and with clients.

What it improves: Grouping related pages under one main page strengthens all of them together. Google sees Fit4Steps as a specialist in senior fitness rather than a site with a few scattered senior pages, and visitors can explore the full senior offering from one place.

2. Every service gets its own page

What changed: Prenatal and Postnatal Yoga, Corrective Exercise for Lifestyle Diseases, Stress Management Training, Personalized Online Training and Corporate Yoga and Fitness each get a dedicated page. Strength Training for Seniors and Joint Restoration also get their own pages, as parts of the existing senior service.

Why: Google ranks individual pages, not whole websites. Right now these five services appear only as headings on the Services page, with no page behind them, so they cannot appear in search results at all. The homepage's Corporate "Learn More" button also currently leads nowhere.

What it improves: Every service Fit4Steps offers becomes visible in search. Visitors interested in a specific service land on a page about that service instead of a general list.

3. A dedicated Locations section

What changed: A Locations section is added with pages for Noida, Delhi and Gurugram. The existing Delhi and Gurugram pages are organized beneath their city.

Why: Noida is the head office, but it is the only city without its own page. Noida searches are currently split between the homepage and the in-home training page, which is why "personal fitness trainer in Noida" sits at #5 while comparable Delhi and Gurugram searches rank #1 and #2. Gurugram has five ranking pages but no main page connecting them.

What it improves: Each city gets a clear main page supported by its related pages, which strengthens local rankings. The Google Business Profile stays linked to the homepage until the Noida page is established, so the current Noida map rankings are protected.

4. A Blog for informational content

What changed: A Blog is added, with categories that match the services: Senior Fitness, Joint Pain and Mobility, Home Workouts, Pregnancy and Postnatal, Kids Fitness, and Corporate Wellness. The Exercises for Knee Pain and Safe Exercises for Elderly pages move into the blog.

Why: These two pages, along with the mobility exercises page, have not ranked at all in six months. People searching "exercises for knee pain" want a guide, while these pages are written as service pages. Moving them does not affect any current rankings. The mobility page stays where it is because it ranks #2 for "senior citizens exercises Delhi."

What it improves: The site can rank for questions people search before they are ready to hire a trainer. Each blog post also links to a related service page, bringing that interest to the services.

5. An Our Trainers page

What changed: A page presenting the trainers, their qualifications and experience is added under About.

Why: For health and fitness topics, Google places extra weight on who is giving the advice. Client testimonials repeatedly mention Satheesan by name, but the site has no page about him or the team.

What it improves: It builds trust with both Google and visitors, and gives the expertise behind Fit4Steps a clear place on the site.

6. An FAQ page

What changed: A page answering common questions about sessions, pricing, locations and how home training works is added.

Why: Prospective clients have the same questions before booking, and these are also common search queries.

What it improves: It answers questions before a visitor has to call and helps the site appear for question-based searches.

7. Cleaner URLs for Programs and Success Stories

What changed: Program page URLs change from formats like /yoga_detail_page to /programs/yoga, and /success_stories becomes /success-stories. All old URLs redirect to the new ones.

Why: Google recommends hyphens rather than underscores in URLs, and the current format is hard to read. None of these pages rank for tracked keywords, so the change carries little risk.

What it improves: URLs are consistent, readable and grouped under Programs. This is a housekeeping improvement rather than a major ranking change.

Summary

The new architecture keeps every page that currently ranks, organizes all pages into a clear structure, and adds pages for services, cities and topics that currently have no presence in search. The result is a site where every important page is easy to find for visitors and for Google, and where each page supports the others.

Changed Footer

Senior Fitness	Services	Programs	Company
Senior Citizen Training	Personal Training at Home	Weight Training	About Us
Fitness for 50+	Female Trainers	Yoga	Our Trainers
Strength Training	Couple Training	Power Yoga	Success Stories
Joint Restoration	Kids Training	Pilates	Blog
Mobility & Balance	Prenatal & Postnatal	Aerobics	FAQ
Senior Fitness Trainer Delhi	Corrective Exercise	Kick Boxing	Contact
Strength Training Delhi	Stress Management	Stretching & Mobility	Locations
Senior Fitness Trainer Gurugram	Online Training	Ball Exercise	Noida

Strength Training Gurugram	Corporate Wellness	Circuit Training	Delhi
Senior Exercises Gurugram		HIIT	Greater Kailash
		TRX Exercise	Gurugram
		Sports & Games	

Proposed Footer: Changes and Reasons

1. Links grouped under clear headings

What changed: The unstructured Quick Links strip is replaced by four columns: Senior Fitness, Services, Programs and Company, with Locations as a subsection of Company.

Why: The current footer lists 15 pages in one block with no grouping, so neither visitors nor Google can tell how the pages relate to each other.

What it improves: Visitors can find a service or city at a glance, and the headings give Google context about what each linked page covers.

2. All currently ranking pages keep their footer link

What changed: Every page from the current Quick Links remains in the footer, now placed under the relevant heading.

Why: The footer appears on every page of the site, so these links help the pages that hold top rankings today. Removing them would put those rankings at unnecessary risk.

What it improves: The footer gets organized without giving up any of its current SEO value.

3. Shorter, clearer link text

What changed: Link text like "Best Personal Fitness Trainer Delhi" becomes "Delhi" or "Senior Fitness Trainer Delhi."

Why: Keyword-heavy link text repeated on every page can look manipulative to Google. The column headings and the pages themselves already carry the keywords.

What it improves: The footer reads naturally for visitors and avoids a pattern Google treats with suspicion.

4. Info and Quick Links merged into one footer

What changed: The separate Info column and Quick Links strip are combined into the four-column layout.

Why: The current footer has three separate blocks, and the Info column repeats the main menu.

What it improves: One footer with a single clear structure instead of three disconnected sections.

5. Business details unchanged

What changed: The address, phone number and email stay at the top of the footer exactly as they are.

Why: These details must match the Google Business Profile exactly to support the Noida map rankings.

What it improves: Local search signals stay consistent while the rest of the footer is reorganized.
